2023/05/13 | Attribute Consumption issue

Rule : useridPostpaidTFVelocity_PP_Trustlist

Attribute : id_muid1__eid_31d

Domain : PG

Rule Logic :

> *If a user has already made two successful Tuition Fee transaction using his/her postpaid account in a calendar month, then his/her third TF - postpaid transaction should be blocked*

How did the bypass happen

- This user - **216810000015912329154** has already made two successful transactions
- The third transaction ideally should have been blocked, but the transaction got bypassed by the rule.
- The attribute did not consume two out of three successful transactions even though they fulfilled all the conditions required.

Blockers

Since these are transactions from May 4, kafka topic will not have any records on them (retention period is 2 days) so we are blocked on the investigation. The transactions happened when the attribute was down at that point of time, it was suggested that could be possible reason why it was missed.

Action Item : M* team to analyze on Cassandra end. For more details on the request : https://paytm.slack.com/archives/C019JNJH18B/p1683902129230269
